## **Press release**

### **The COVID-19 vaccination campaign is responsible for excess mortality in Israel and Australia**

A scientific article written by Prof Denis Rancourt, Dr Marine Baudin, Dr Joseph Hickey and Dr Jérémie Mercier published as a report by *Correlation Research in the Public Interest* (<https://correlation-canada.org/report-age-stratified-covid-19-vaccine-dose-fatality-rate-for-israel-and-australia/>) shows, based on analysis of all-cause mortality in Israel (Central Bureau of Statistics data) and Australia (Australian Bureau of Statistics data) that:

- **Virtually no excess mortality is detected between the declaration of a pandemic by the WHO on 11 March 2020 and the beginning of the COVID-19 vaccination campaigns.**
- **A significant increase in all-cause mortality is observed from January 2021 in Israel, and from March 2021 in Australia, in synchronicity with the rollout of the COVID-19 vaccines.**
- **The excess all-cause mortality during the vaccination period (from end of December 2020 to end of October 2022 in Israel and from mid-March 2021 to mid-September 2022 in Australia) amounts to 9,600 deaths in Israel and 32,600 deaths in Australia.**
- **Abnormal all-cause mortality peaks are observed during the summer season of the two countries, from July to November 2021 in Israel, and from mid-January to mid-February 2022 in Australia, synchronous with the rollout of the boosters.**
- **The vaccine-dose fatality rate increases exponentially with age, reaching almost 1 % among the elderly.**

The authors demonstrate that the COVID-19 vaccines are toxic, and that this toxicity increases with the age of the injected person. They emphasize that it was reckless to vaccinate the most frail residents, which includes the elderly. They advise changing public health authority policies and messaging regarding COVID-19 vaccination.
