Press release

The COVID-19 vaccination campaign caused excess mortality in the Southern Hemisphere

A scientific article by Prof Denis Rancourt, Dr Marine Baudin, Dr Joseph Hickey and Dr Jérémie Mercier and published by *Correlation Research in the Public Interest* (<https://correlation-canada.org/covid-19-vaccine-associated-mortality-in-the-southern-hemisphere/>) shows, based on analysis of all-cause mortality in 17 equatorial and Southern-Hemisphere countries (using data from *World Mortality Dataset*), that:

- In all the countries studied (Argentina, Australia, Bolivia, Brazil, Chile, Colombia, Ecuador, Malaysia, New Zealand, Paraguay, Peru, Philippines, Singapore, South Africa, Suriname, Thailand, Uruguay), **transitions to higher regimes of all-cause mortality** are observed **when the COVID-19 vaccines are deployed**.
- **No excess mortality is detected between the WHO's pandemic declaration** of 11 March 2020 **and the beginning of the COVID-19 vaccination campaigns** in 9 of the 17 countries studied.
- **Abnormal all-cause mortality peaks are observed** in January-February 2022, during the summer season of the Southern-Hemisphere countries, **synchronously with or following the rollouts of the boosters**, in 15 of the 17 countries studied.
- **The excess all-cause mortality during the vaccination period** (from January 2021 to when the data end for each country) **amounts to 1,745,000 deaths** for the 17 countries studied, which corresponds to approximately 1 death per 800 injections.
- **The vaccine-dose fatality rate increases exponentially with age, reaching almost 5% among those over 90 years old exposed to a 4th dose.**

The authors demonstrate that the COVID-19 vaccines are toxic, and that this toxicity is about 1,000 times larger than that reported in clinical trials or estimated from pharmacovigilance databases. They call on governments to end the public health policies prioritizing COVID-19 vaccination of the elderly.
